Velos eResearch Account Management provides the system framework to configure and manage organizations, users, research networks, and portals. A powerful security system underlies account management and enables robust system deployments at the enterprise level and integrated investigator/ sponsor research networks.

Managing Organizations & Networks

Each customer account is configurable to the unique needs of the organization, including forms, processes, links, and reports. Individual users and user groups can be given system access based on a variety of criteria including roles, patient or study access rights; need for view-only access; access to patient-identifiable information, etc. Similar rights can be configured for multi-site networks.

Notifications and Messaging

Message sharing and subscription capabilities are provided throughout the system. Alerts and Reminders can be configured to any number of communication or information sharing needs. For example, investigators can subscribe to receive notifications when a patient is enrolled or a case report form is submitted, Coordinators can receive advance notification of scheduled patient visits, etc. Notifications are assembled in a convenient daily email to prevent email overload. Study administrators can easily specify users or teams that should receive these notifications, which can be configured at a granular level and re-used across the application. These powerful messaging capabilities improve productivity, facilitate workflow management, increase study and regulatory compliance, and foster patient safety.

My Velos eResearch Dashboard

Individual users have access to their Velos eResearch Dashboard with specific links, reports, and other information that meet their unique needs. Every individual user's "view" can be unique. System access is configurable at the menu, function, and page levels. Throughout Velos eResearch, views and reports are context sensitive so that retrieved information is always filtered based on individual user access rights. Access rights can be configured on the basis of roles which can greatly speed security configuration.
