Velos eResearch supports structured protocol management and enables users to maintain patient-, population-, and study-specific protocol information. Velos eResearch Study Setup supports important aspects of research management and administration including protocol design, workflow and study status management.

Protocol Design

The protocol calendar is constructed from a powerful library toolset that enables reuse of protocol components. At the heart of the library system is the Event library comprised of the individual events represented in a protocol. Each event may be associated with a variety of information including event type, messages, duration, and core report form details. Such event attributes are maintained and re-used for new protocols assembly. Events can be copied, modified and incorporated in other calendars. In addition to scheduling, the protocol calendar supports a host of related information needs including workflow management, communication, and budgeting and billing.

Study Setup and Team Creation

Velos eResearch users can easily and quickly create protocols, design forms, and share their protocol with other select users. Calendars are stored in a library and configured to the specific scheduling needs of each study. Alerts, notifications, and reminders can be configured throughout the schedule and set to notify team members of study activities or needs. Statuses for each event in the schedule are maintained and can be tracked, changed, and reported on. Online and printed reports can be generated anywhere, anytime and contain up-to-the-minute information.

Status and Workflow Management

Structured status information enables all stakeholders to understand activities taking place that relate to their areas of responsibility. Status and workflow management tools available throughout Velos are the glue that brings together the individual user constituencies and user perspective into a unified, productive organization.
